

Gateway Corporate

Intelligence software for decisions, operations, and digital trust

What we do: Gateway Corporate designs and deploys intelligence software that helps organizations operate with more certainty. Instead of isolated tools, we build connected systems where decision engines, operational workflows, and risk controls reinforce each other. Our stack combines digital-twin simulation, CRM-native automation, and production device intelligence so teams can move faster without sacrificing governance, explainability, or system integrity.

Across our platform, intelligence is treated as an operational layer: signals are structured, recommendations are testable, and actions remain policy-bound for real-world reliability and auditability.

DECISION INTELLIGENCE + GOVERNED AUTOMATION + DIGITAL TRUST

NashTwin CRM

A living digital twin and strategic simulation engine for operators who need to evaluate outcomes before execution.

Map → Simulate → Optimize

Problem it solves: Traditional CRMs record the past but cannot test strategic options before commitment.

Why it matters: NashTwin allows leaders to test pricing, staffing, and vendor moves against a modeled operating reality.

Advantages

- Nash equilibrium solving for stable strategic states.
- Thousands of what-if simulations with scenario branching.
- Pareto and coalition analysis for decision tradeoffs.
- Continuous re-optimization as inputs change.

∞ Scenarios

Game Theory

HyperLocal 2

CRM-native conversational operations built for governed inbound SMS with strict operator control.

Route → Ground → Govern

Problem it solves: Messaging systems are often either manual and inconsistent or automated and unsafe.

Why it matters: HyperLocal converts inbound SMS into policy-bound workflows that preserve context, permissions, and auditability.

Advantages

- Route-aware tenant workflows with explicit policy boundaries.
- Permissioned contact and calendar actions by design.
- Deterministic fallback behavior on AI failure.
- Operational transcripts and audit trails for control.

Safe Fallback

CRM-Native

Devicer Intelligence Suite

Open-core device intelligence with production plugins for identity confidence and abuse defense.

Signals → Score → Enforce

Problem it solves: Browser-level identity alone is too brittle for production risk and trust decisions.

Why it matters: Devicer brings server-side memory, network intelligence, and explainable scoring into real traffic pipelines.

Advantages

- 30+ signals, 0-100 confidence scoring, and 99% accuracy claim.
- JA4 and JA3 TLS consistency with IP enrichment.
- Bot mitigation from up to 13 named scoring factors.
- Peer trust and taint propagation across clusters.

30+ Signals

0-100 Score

Why this matters for buyers: Gateway Corporate delivers a unified intelligence stack where strategic planning, customer operations, and digital trust systems operate together instead of in silos. The result is faster, higher-quality decisions, safer automation, and measurable software advantage.
